ANTIUROLITHIATIC ACTIVITY
OF THE PLANT EXTRACTS OF SOLANUM VIRGINIANUM
ON ETHYLENE GLYCOL INDUCED UROLITHIASIS IN RATS

ABSTRACT
Objective: To study the antiurolithiatic activity of Solanum virginianum (Solanaceae) in ethylene glycol induced urolithiasis in male Spargue Dawley rats.

Methods: The urolithiasis was induced in rats by oral feeding of ethylene glycolated water (0.75%v/v) for 28 days. Ethanolic extract of Solanum virginianum (200 mg/kg, 400 mg/kg) was administered orally from 1st day for preventive regimen and from 15th day for curative regimen. Results: It was observed that the inducing agent ethylene glycol elevated the ionic parameters, calcium and phosphate levels in urine, blood urea nitrogen (BUN), serum creatinine and serum uric acid levels. Treatment with ethanolic extract of Solanum virginianum significantly (P<0.001) reduced the elevated levels of ions in urine as well as BUN, serum creatinine and serum uric acid levels.

Conclusion: The elevated calcium and phosphate levels in urine, serum creatinine, blood urea nitrogen (BUN) and uric acid levels of urolithiasis induced rats were reduced with preventive and curative regimens of plant extract treatment. The histological findings also showed improvement in kidney architecture after treatment with the plant extract. These observations enable us to conclude that the Solanum virginianum has curative and preventive properties for ethylene glycol induced urolithiasis in rats.

KEY WORDS
Urolithiasis, Ethylene glycol, Solanum virginianum, Hyperoxaluria, Micro crystals.

INTRODUCTION
Urolithiasis is a complex process which is a consequence of an imbalance between promoters and inhibitors in the kidneys^1^. Even after the technological developments in the present medical practice, the formation and growth of renal calculi continues to afflict humankind. Though various kinds of stones have been identified, calcium stones are the most common in human as well as in rats^2^. Urolithiasis is a common disorder estimated to occur in approximately 12% of the world population, with a recurrence rate of 70-81% in males and 47-60% in females^3^. The recurrence of urolithiasis represents a major problem as patients who have formed one stone are more likely to form another.

The synthetic drugs used to prevent urolithiasis are not effective in all patients, and many of them have adverse effects that compromise their long term use. In the present day management of urolithiasis with open renal surgery is an unusual and rarely used one since the introduction of Extracorporeal Shock Wave Lithotripsy (ESWL) which has almost become the standard procedure for eliminating kidney stones^4^.

However, in addition to the traumatic effect of shockwaves, persistent residue stone fragments and the possibility of infection suggests that ESWL may cause acute renal injury, a decrease in renal function...
and an increase in stone recurrence. Hence, the search for effective antilithiatic drugs without or minimum side effects from natural sources has gained a great potential.

*Solanum virginianum* is a very prickly perennial herb with woody base plant from the family Solanaceae which is common throughout India, Sri Lanka, Burma, Malaysia and Nepal. The plant is used in rheumatism, asthma, also as diuretic, anthelmintic and anti-inflammatory substance. The aerial parts and the roots are used in herbal preparations. *S. virginianum* is endowed with various chemical components such as alkaloids, flavonoids, phytosterols, mucilage and fixed oil etc., which possibly contribute to its vast uses in folklore medicine. The present study was planned to evaluate the antiurolithic activity of ethanolic extract of *Solanum virginianum* whole plant on ethylene glycol induced calcium oxalate urolithiasis in male rats.

**MATERIALS AND METHODS**

**Plant material**

The plants of *Solanum virginianum* were collected from surroundings of Warangal, Andhra Pradesh, India and the plant was authenticated by plant taxonomist Prof. D.V.S.Raju., Department of Botany and Plant anatomy research center, Kakatiya University, Warangal, Andhra Pradesh. The voucher specimen of the plant was deposited at the college for the future reference.

**Preparation of ethanolic extract**

The whole plants of *Solanum virginianum* were cleaned and chopped into small pieces and dried under shade. The coarse powder was obtained by mechanical grinding. The powdered material (100 g) was subjected to continue hot extraction in soxhlet apparatus at a temperature of (60-70°C) by using ethanol (95% v/v) as solvent. After complete extraction, the extract was dried. The yield was about 5% w/w and it was stored at 4°C in desiccator. The extract was suspended in distilled water using 1% acasia as suspending agent for oral administration to animals.

**Experimental animals**

The Spargue dawley rats, weighing 150-200g, were procured from Teen baobabs Pvt. Ltd. (Rag, no. 177/99 CPCSEA), Hyderabad, Andhra Pradesh. And they were housed at CPCSEA (Rag, no. 1278/ac/09/cpcsea) approved animal house of St. John College of Pharmacy, Warangal. The animals were kept in polypropylene cages (6 in each cage) under standard laboratory condition (12 hr light and 12 hr dark cycle) and had free access to commercial pellet diet (Hindustan lever Ltd, Bombay, India) with water ad labium. The animal house temperature was maintained at 25 ± 2°C with relative humidity at (50 ±15%). Ethical norms were strictly followed during all experiments and the study was approved by the Institutional Animal Ethical Committee of St. John College of Pharmacy (Reference No: 001/IAEC/StJCP/2011).

**Acute Toxicity Study**

The acute toxicity of ethanolic extract of *Solanum virginianum* was determined as per the OECD guideline no.423 (Acute Toxic Class Method). It was observed that the test extract was mortal even at 2000mg/kg dose. Hence, 1/10th (200mg/kg) and 1/5th (400mg/kg) of this dose were taken as a therapeutic dose for determination of antiurolithic effect.

**Pharmacological screening for anti urolithiatic activity**

Animals were divided into seven groups, each containing six animals. Group I animals served as normal control and maintained on regular laboratory diet and water ad labium. Group II to VII animals were fed with 0.75% ethylene glycol (EG) in water to induce renal calculi till 28th day. Group III animals received standard antiurolithic drug cystone (750 mg/kg body weight) from 15th to 28th day. Group IV & V animals served as curative regimen and received ethanolic extract of the plant of *Solanum virginianum* at a dose of 200 mg/kg and 400 mg/kg body weight from 15th day to 28th day. Group VI & VII animals were served as preventive regimen and received ethanolic extract of the plant of *Solanum virginianum* at a dose of 200 mg/kg and 400 mg/kg body weight from day 1st day to 28th day. Both the extracts were administered once daily by oral route.

**ASSESSMENT OF ANTIUROLITHIATIC ACTIVITY**

**Collection and analysis of urine**

Urine samples were collected on 28th day for 24 h by keeping the animals in individual propylene metabolic
cages. Animals had free access to drinking water during the urine collection period. The collected urine was analyzed for calcium and phosphate using standard methods. The volume of urine collected from all groups was recorded. Further, microscopy of the urine was performed to identify the presence of crystals.

**Serum analysis**
After the experimental period, the blood was collected from the retro orbital puncture of rat eye under ether anesthesia. Serum was separated by centrifugation of the blood samples at 10,000 RPM for 10 minutes and analyzed for creatinine, uric acid and BUN using standard methods.

**Effect of *S. virginianum* plant extracts on the kidney weight**
The weights of the kidney of normal, induced, standard drug treated and extract treated group rats were weighed. The Group II animals gained the least body weight as compared to the normal control and extract treated groups. In addition, the wet weight of kidneys were taken and compared between the groups.

**Histopathology**
To confirm the incidence of urolithiasis the animals were sacrificed and their kidneys were isolated and subjected to histopathological studies. The kidneys were cleaned off from extraneous tissue and transferred to 10% neutralized formalin solution (pH 7.4). Sections of kidney was fixed in paraffin, stained with hematoxylin and eosin and observed for histopathological studies.

**Statistical analysis**
Statistical analysis was carried out using Graphpad Pism (version 5) software. Results were expressed as mean ± SEM. Groups of the data were compared applying one-way ANOVA followed by Dunnett’s Multiple Comparison test. Differences between the data were considered significant at P<0.05.

**RESULTS**

**Antiurolithiatic study**

**Urinary excretion of calcium and phosphorous**
In the present study, chronic induction of EG (0.75% v/v) to male Spargue dawley rats resulted in significant (P<0.001) increase in urinary excretion of calcium and phosphate. Whereas the cystone-treated group III animals were shown significant reduction in calcium (P<0.0001) and phosphate (P<0.001) levels. Similarly treatment with *Solanum virginianum* significantly lowered the elevated levels of calcium (P<0.0001) and phosphate (P<0.0001) in urine curative regimens and preventive regimen as compared to EG induced group II animals (Table 1).

**Serum analysis**
The blood urea nitrogen (BUN), serum creatinine and serum uric acid levels were significantly (P<0.0001) increased in calculi-induced group II animals. While the BUN, serum creatinine and serum uric acid levels were significantly (P<0.001) decreased in cystone-treated group III animals. However, the BUN and serum creatinine levels were significantly (P<0.0001) decreased in both preventive and curative regimen groups. It is also found that there is no significant reduction in serum uric acid levels in curative regimens (Group IV and Group V), but the preventive regimens shows a significant (P<0.0001) reduction in elevated serum uric acid levels (Table 1).

**Kidney Weights and Urinary Volume**
The kidney weight was significantly (P<0.001) increased in ethylene glycol induced group II animals when compare to the control group animals. Whereas the standard treated group animals was shown significant (P<0.001) reduction in the kidney weight when compared to the EG induced group II animals. Similarly a significant (P<0.0001) decrease in the kidney weight is also identified in *Solanum virginianum* treated preventive and curative regimens (Table 2). The urinary volume was significantly (P<0.001) decreased in ethylene glycol induced group II animals when compared to the control group animals. Whereas the standard treated group animals was shown significant (P<0.01) increase in urine output when compared to the EG induced group II animals. Similarly a significantly increase the urinary volume is also identified in *Solanum virginianum* treated preventive regimen (P<0.0001) and curative regimen (P<0.05) animals (Table 2).

**Histopathological studies**
Histopathological studies of kidneys clearly revealed that the tissue section of Group I rats showing normal size tubules with single epithelial lining along the margin. Whereas the Group II rats showed dilated

tubules and degeneration of epithelial lining with presence of crystals. But the kidney specimen from standard and extract treated groups showed characters similar normal control group (Figure 1).

**DISCUSSION**

Urolithiasis can be produced in rats by induction of acute or chronic hyperoxaluria by using a variety of agents such as ethylene glycol, sodium oxalate, ammonium oxalate, hydroxyl-L-proline and glycolic acid. Kidney being the principal target for EG induced toxicity. EG is broken down in-vivo into four organic acids viz., glycolaldehyde, glycolic acid, glycooxalic acid and oxalic acid leading to hyperoxaluria which is the main initiative factor for lithiasis. Therefore in the present study, EG was preferred to induce lithiasis. Administration EG to the experimental animals for 28 days resulted in substantial elevation of oxalate and deposition of microcrystal’s in kidney. In addition, oxalate precipitates as a calcium oxalate crystals in kidney since the oxalate metabolism is considered almost identical between rats and humans.

Calcium and phosphate play a vital role in renal calculogenesis. In EG induced rats, the urinary excretion of calcium, phosphate was significantly increased. The increase in calcium and phosphate excretion could be due to defective tubular reabsorption in the kidneys. While treatment with standard, curative and preventive regimens of *S. virginianum* markedly reduced the levels of these ions, suggested protective effect of *S. virginianum* against urolithiasis.

In urolithiasis, the calculi formed in the renal tissue leads to obstruction in the urinary system that...
decreases the glomerular filtration rate (GFR) and cause an accumulation of certain waste products like nitrogenous substances e.g., BUN, creatinine and uric acid in the blood. Marked renal damage was seen in EG induced rats indicated by decreased GFR, significant kidney weight gain and elevated serum level of BUN, creatinine, and uric acid. However treatment with ethanolic extracts of S. virginianum plant extracts in both curative and preventative regimens caused diuresis along with loss of kidney weight and also decreased the elevated serum level of BUN, creatinine and urea.

The findings of the histopathological studies suggested that no microcrystalline deposition and deposition and kidney damage in the S. virginianum extract treated groups all these observations enabled us to confirm the preventive curative potential of S. virginianum on ethylene glycol induced lithiasis. In conclusion, the ethanolic extract of S. virginianum has both preventive as well as curative property in urolithiasis of rats. These finding, thus prompt the necessity for further study to carry out the antiliathiatic effect of S. virginianum by isolation of constituents and find out the actual constituent that active against stone formation.
