## Abstract

The present paper deals with the survey of research work done on various aspects of bryophytes in Madhya Pradesh state. The study revealed that very little work has been done on bryophytes in this state and only 83 taxa have been reported as compared to 2523 freshwater taxa from India and 16236 species in the world (Chapman, 2009 and Singh & Dash, 2014). Out of the total 83 species belonging to 56 genera and 32 families reported from M.P., 33 species belong to liverworts, 7 species to hornworts and 43 species to mosses. The ratio of genera to species is 1.48 which is slightly low as compared to 1.51 in India. This lends support to the generalization that smaller the flora, the genus-species ratio should decline within the same floral region. Fissidentaceae (8sp.), Hypnaceae (7 sp.), Rebouliaceae (5 sp.) and Marchantiaceae (5 sp.) are the dominant families with 5 more taxa in surveyed districts of Madhya Pradesh. As regards bryophytic studies in M.P. so far it has been done only in 11 districts out of 52 districts. i.e., Anuppur, Barwani, Bhopal, Chhindwara, Gwalior, Hoshangabad, Khargone, Mandla, Rajnandgaon, Sagar and Ujjain. The study suggests that there is still much necessity of doing further research work in bryophytes of other districts of this state.

## Keywords

Central India, enumeration, amphibious plants, lower embryophyta, , lower cryptogams, liliputian plants

## INTRODUCTION

Bryophytes are seedless plants without specialized water conducting tissues. They are non-vascular embryophytic plants. Instead of a monophytic group, it is an informal group consisting of 3 paraphytic groups. Its plants are monoecious. In past years, enough focus has not been given to study the bryophytes in India. This group has been and still is a somewhat neglected branch of Botany in India. It has been ignored for many reasons especially their relatively less economic value, but recent studies have proven that they could be the resource of many phytochemical and pharmaceutical compounds.

The progress of bryophytic systematics has been reviewed from time to time in the past not only in

taxonomy and morphology of the group, but also in such fascinating fields as cytology, physiology, palynology, palaeobotany, and tissue culture morphogenesis. However, a great deal of information has yet to be obtained from investigations on these plants which are so richly represented in India due to favourable conditions of their growth.

The present review deals with the work done on the taxonomy of bryophytes by the research workers of Madhya Pradesh up to the period 2015. In the past few decades some important publications and monographs on bryophytes have been published in India ( Bapna,1958; Bharadwaj,1948; Bir,1970; Blatter,1929; Brotherus,1898; Chopra,1960;

Chatterjee,1964 Chopra & Kanta,1966; ,1943 ; Dixon,1909; Evans,1939; Kachroo,1951; Khanna,1959; Kuwahara1965; Mahabale,1958; Maheshwari & Kapil,1963; Mehra,1967; Mehra & Handoo, 1963; Mizutani,1963; Pande & Udar,1959 and Sedgwick,1910

## TAXONOMY

Kashyap (1914) is considered as the founder of Indian bryology on account of his excellent publication on West Himalayan hepaticas as it was the first publication by an Indian worker. This created a renaissance in bryological research in India and a number of workers started investigations on bryology and through active work at some research centers, such as Lucknow, Bhopal and Ujjain and they are still contributing to our knowledge about these group of plants. Although Kashyap's research influenced extensive work on Indian hepaticas, the mosses remained a neglected field of study for a long time.

Taxonomic studies in Madhya Pradesh continue to receive attention from various workers as in the past (Saksena, 1947; Pandey and Srivastava,1952; Udar,1956; Handoo,1959; Bhargava and Thampi,1960; and Nath, 1971) Bryophytic genera and species discovered and described by various research workers of M.P. have been listed and are not referred to individually. All the species of bryophytes reported from the state belong to freshwater habitats.

Although an attempt has been made to include most of the bryophytic members described so far from this state up to the year 2015, no claim is made that the list is complete. Omissions if any , may be pointed out by the readers. The preset authors do not take the responsibility for the correctness of the identification made by various workers listed under references. The main object of this paper is to provide information about the scattered literature at one place along with the list of bryophytes published. Madhya Pradesh appears to be sufficiently rich in bryoflora but still it needs an extensive survey for the exploration of bryophytic wealth from all possible habitats which have not been explored so far. This important task is continuing by various bryologists at Gwalior, Bhopal, Ujjain, and Sagar stations. In Mandla district some fossils are collected but there is some doubt that these fossils belong to late jurassic or the early and mid-jurassic period.

Singh (1966) has mentioned that Madhya Pradesh state has a varied topography but almost one-third of its area is forested from the total forest area of 20.68% in India. The forest area of M.P. includes mainly tropical moist forest (8.95%), tropical dry deciduous forest (88.65) and tropical thorn forest (0.26%). From the total RFA of 94689 sq.km. area of this state, 61886

sq. Km. Area is reserved forest, 31098 sq.km. under protected forest and 1705 sq. Km. is unclassed forests. The biodiversity is stunning with over 1300 species of plants including numerous rare bryophytes and pteridophytes in Satpura range of M.P which includes the Satpura Tiger Reserve forest of Pachmarhi ( Hoshangabad) but as far as bryophytes are concerned, they are yet to be described and many remote geographical areas need to be adequately surveyed. Till now 83 species belonging to 56 genera and 32 families have been reported from the state and all these taxa belong to fresh water (Table I). Now a days palynological and tissue culture morphogenesis work on bryophytes is also attracting the attention of the bryologists.

Because of conflicting opinions of various bryologists, the order of presentation of the various divisions does not confirm to any particular system of classification. The bryological taxa under each division have been arranged in alphabetical order and wherever possible, reference has been made as to which system has been followed for the arrangement of genera and species.

### Class I. Hepaticopsida:

Most of the taxa of this class have been described mainly from Pachmarhi . In all 33 species belonging to 22 genera and 12 families are reported from the state.

**Class II. Anthocerotopsida:** Only 7 species belonging to 4 genera of 3 families are reported mainly from Pachmarhi, Bhopal, Gwalior, Mandla and Khargone stations.

**Class III. Bryopsida:** This class is represented by 43 species and 30 genera and 17 families. Members of this group are reported mainly from Pachmarhi, Amarkantak, Bhopal and Sagar stations. A majority of the bryophytic species are found on damp habitats but some species grow as epiphytes ( *Plagiochilla*, *Porella* and *Lejeunea*), epiphyllous ( *Radula perrittotii* ), xerophyllous ( *Asterella angusta*, *Reboulia hemispherica*, *Targionia hypophylla* ) and submerged species ( *Riccia fluitans* ) The epixylic species mostly belong to the family Dicranaceae, Cephalozieaceae, Brachytheciaceae, Hypnaceae, Fissidentaceae, Plagichilaceae, Radulaceae, Leucobryaceae, Lejeuneaceae, Sematophylaceae, Stenophyllaceae , Metzgerineae and Lepidoziaceae .

Studies have shown that in Central India (including Madhya Pradesh), Pottiaceae is a dominant family and *Fissidens* is a dominant genus with 26 taxa and on account of this , it is considered as one of the bryogeographical zones. Due to water pollution by textile industries complex of Birla Nagar, Gwalior, M.P., a gradual decline in aquatic bryophytes has occurred. Mosses and liverworts traits are considered useful indicators of deadwood decay in forest management. In a study it has been found that out of 56 species of

bryophytes, 29 species are reported to possess antibacterial activity. In India out of 269 endemic species, Riccia, Frullenia, Lejeunea, Pallavicinia, Plagiochasma, and Jungermannia are among liverworts, Anthoceros in Hornworts and Fissidens, Bryum, Campylopus species are endemic in large numbers among mosses.

Table 1. shows the biodiversity of bryophytes in different regions of India, Table 2. shows the distribution of total species, genera and families belonging to different classes of bryophytes in different zones and districts of Madhya Pradesh, Table 3. Indicates the alphabetical enumeration of bryophytic taxa and Table 4 indicates the total species and genera belonging to various families.

#### ACKNOWLEDGEMENTS

The authors are grateful to Late Professor Dr. Ram Udar, Department of Botany, Lucknow University, Lucknow for providing his valuable research papers on my personal request and Dr. Virendra Nath, Emeritus Scientist, N.B.R.I, Lucknow for cordially sparing reprints of his valuable research papers. Thanks are due to Dr. Ashok Kaul, Botany Department, Madhav Science College, Ujjain (M.P.) , and Dr. R.M.Shukla , Department of Botany, Govt.Girls College, Ujjain (M.P.) for encouragements and gladly providing the lists of their research papers on bryophytes . Thanks are also due to Dr. D.D. Mahajan, Principal, Govt. P.G. College, Khargone and Dr. Mukesh Jain, Principal, Govt. S.N.P.G.College, Khandwa for providing library facilities.

- 1980.Reproductive biology of *Marchantia paleacea* Bert. *Jour. of Jiwaji University.* VIII, (1) 123-130.
1980. Effect of photoperiod on germination and gemmaling growth of gemme in *Marchantia paleacea* Bert. *Biologia* ,p,1.
1981. Energy structure in relation to weed density. *Proc. of National Sympoium on Dynamics of energy flow in Biological systems.* Saurastra University.
- 1980 .Rhiosphere mycoflora of liverworts. *Second All India Symposium on life Science.* 71-31.
- 1980.Phytosociological studies on *Plagiochasma* Community. *First Indian Conference of Ecology and Environmental Science.* 159:64.
1981. Isolation of protoplasts from *Marchantia Paleacea* Bert. *Reaserch Journal of Bhopal University.* (I) 30-31.
- 1980 .In vitro studies of *Marchantia paleacea* Bert. II. Influence of nutrients. *Einstain Centenary Sympsum,* Nagpur.
1981. Influence of Moisture regime on the growth of *Plagiochasma appendiculatum* L.et.L. *Acta Botanica India.* 9:186-193.
- 1981 Chlorophyll concentration in two generations of *Funaria hygrometrica* Dill. *VIII Annual Conference of society for Advancement of Botany.*
1981. Influence of Mineral salts on spore germination of *Plagiochasma appendiculatum* L. et. L. *GEOBIOS:* 116-118.
1981. Annual Net Production Studies of *Funaria hygrometrica* at Gwalior "Silver Jubilee Symponium" ISTE. .
1981. Interspecific association for the species of a liverwort community. "Silver Jubilee Symponium" ISTE.
- 1982 Influence of pH on spore germination of *Plagiochasma appendiculatum* L.et. L. *Misc. Bryol. Et. Lichenol.* 9:4:76-78.
1983. Influence of light on spore germination of *Plagiochasma appendiculatum* L.et.L. *Misc. Bryol. Et. Lichenol.* 9:7:, 153-156.
- 1983.Seasonal variation in Thallus Area of a Liverwort community. *IAB World conference of Bryology.* Tokyo
1983. Population Differentiation in a liverwort community. *IAB. World conference of Bryology.* Tokyo.
1984. Studies of liverworts litter fungi, *YUSHANIA*, 1;(40:27-32.
1985. Influence of growth substances on spore germination of *Plagiochasma appendiculatum* L.et.L. *All india seminar on Recent advances in Plant Ecology*
1985. Influence of Mineral Nutrients on the growth of *Plagiochasma appendiculatum* L.et.L. *All India Seminar on Recent Advances on Plant Ecology.*
1985. Preliminary Studies on callus induction in Liverworts *Marchantia paleacea* Bert. *Symposium on Advancement of crops and monitoring envirment.*
- 1985 Studies on Ravines Bryophotic vegetation. *Symposium on Evaluatation I of Productivity Potentials of Chambal and Sindh Ecosystems.* Ambah. (M.P.)
- 1985 .Net Primary Production of a Liverwort Ecosystem at Pachmarhi Central India. I. *A B Conference on Bryoecology,* Hung, Acad. Of Science. VACRAGOG Hungary
1987. Rhizosphere Mycoflora of some Marchantiales. *YUSHANIA* ,4:03), 1-4
1989. *Plagiochila fluticosa* Mitt. An addition to the Bryoflora of Central Indian Zone. *YUSHANIA* ,6: (4) -7.
1989. Interspecific association for Species of a Liverwort Community. *YUSHANIA.* 6:04) 7-16.
1991. Influence of growth substances on spore germination of *Plagiochasma appendiculatum* L.et.L. *YUSHANIA.* 8
